EDUCATION

University of Washington Expected Dec 2026
B.S. in Computer Science (GPA: 3.7/4.0) Seattle, WA

- **Relevant Coursework:** Data Structures and Algorithms, Design & Analysis of Algorithms, Computer Architecture & Systems, Intro to Database Systems, Machine Learning

SKILLS

Languages: Python, Java, C++, TypeScript, JavaScript, SQL, Swift, Bash
Frameworks: FastAPI, React, React Native, Next.js, Node.js, PyTorch
Cloud and Infrastructure: AWS, Docker, Kubernetes, Linux, libvirt, PostgreSQL, pgvector, Supabase
AI and Observability: RAG, QLoRA fine-tuning, vLLM, LLM agents, MCP, Langfuse, Prometheus, Grafana
Developer Tools: Claude Code, Codex, Cursor, Git, GitHub Actions (CI/CD), Jira, incident.io, Atlantis

WORK EXPERIENCE

DigitalOcean Sep 2026 – Present
Software Engineer I Seattle, WA

- Automated conntrack, CPU-throttling, and NVMe health checks across 400+ cloud hypervisors with a Python and Bash toolkit, cutting mean alert investigation time from 28 to 7 minutes
- Developed alert-triage CLI that pulls incident.io context, Jira host history, and playbook steps into one command, eliminating manual lookups and saving ~12 hours per week
- Traced conntrack packet-drop incidents to offending droplets using 2-second packet captures, resolving 60+ production alerts with 98% first-pass accuracy under a peer-approved change process
- Scripted evacuate, refleet, and repave validation for 25+ hypervisors, cutting maintenance rework by 40%

University of Washington Reality Lab Dec 2025 – Jun 2026
Software Engineer Intern Seattle, WA

- Co-developed real-time speech diarization in Swift for Blubble, an Apple Vision Pro assistant for neurodivergent users, streaming audio into NVIDIA Sortformer to separate 4 simultaneous speakers at 95% accuracy
- Implemented multimodal tone analysis engine fusing acoustic features with on-device text sentiment, identifying emotional intent and sarcasm correctly 80% of the time in user testing
- Integrated GPT-4o-mini with keyword-based RAG to render Wikipedia-backed visual aids via SwiftUI, rated relevant 85% of the time in testing with 30 users

PROJECTS

DocuMind – Document-Search AI | *Python, FastAPI, pgvector, Next.js, Docker*

- Built retrieval-augmented generation (RAG) system over 2,000 SEC filings, returning answers with source citations
- Created 150-question evaluation set and raised answer accuracy from 61% to 84% by adding hybrid retrieval, reranking, and query rewriting
- Added CI tests that fail the build if accuracy drops, plus Langfuse tracing and caching that cut cost per query by 45%

QueryForge – Text-to-SQL LLM | *PyTorch, QLoRA, vLLM, Docker, Prometheus, Grafana*

- Fine-tuned Llama 3 8B with QLoRA (8,000 examples) to 82% accuracy vs. 79% for a paid API on 300 tests
- Served model with vLLM on an A100 for 100 concurrent users at 1,800 tokens/sec with p95 latency of 400 ms, cutting cost per million tokens by 85% vs. the paid API
- Charted GPU use, speed, and errors in Grafana and load-tested with Locust to find the breaking point at 140 users

Kairo – Postcard Journal | *Expo, React Native, TypeScript, Supabase (PostgreSQL)*

- Shipped full-stack iOS photo-journal app solo to ~150 App Store downloads, using headless Claude Code agents in isolated git worktrees for planning, building, and testing
- Enforced automated typecheck and iOS build checks on every merge, and gave agents tool access (MCP) and memory across sessions, shipping 39 PRs and 16 database migrations with zero regressions
